

Assumptions:

- Team's group number can only be '1' or '2'.
- Inputs are given such that there are only a maximum of 12 teams in total with 6 teams maximum in each group (as mentioned in the Background excerpt of the problem statement).
- If 1 or more lines of the input results in an error, no data will be inserted into the database.

Architecture decisions:

- The frontend was split into different components and pages for a cleaner and organized look.
- This also separates out the logic required to process and display the data from the backend.
- Since there are only 4 endpoints needed in the backend, and all of them manipulates the "Team" table, they are put together into the same file instead of separating them.
